

How Operators with Ansible make Kubernetes Sing

Carol Chen

Senior Community Architect

Twitter/Github/freenode IRC:
@cybette

The Ansible Operator SDK makes it
easier to deploy and manage Kubernetes
applications with native Ansible support

What is Kubernetes?

An open source orchestration system for implementing a microservices architecture as containerized applications run and coordinated across a cluster of nodes.

Red Hat® OpenShift® is a comprehensive enterprise-grade application platform built for containers with Kubernetes at its core.

Stateless is easy,
Stateful is hard

Kubernetes Operators

Operators simplify management of complex applications on Kubernetes

- Encode human operational knowledge
- **Automatically patch, upgrade, recover, and tune container-based apps and services**
- Kubernetes-native
- Purpose-built for a specific application or service
- Enable “day 2” management

Encoding and automating Ops knowledge

WITHOUT OPERATORS: **REACTIVE**

- Continually checks for anomalies
- Alert humans for response
- Requires manual change to fix

WITH OPERATORS: **PROACTIVE**

- Continually adjusts to optimal state
- Automatically acts in milliseconds

Ansible Operator SDK

Making it easier to deploy and manage Kubernetes apps in an Ansible-native way

operator-sdk new

Use the Operator SDK to create a new skeleton Operator.

Add Ansible Content

Use Ansible Roles and playbooks to manage lifecycle events for your containerized applications.

operator-sdk build

Use the Operator SDK to build and deploy your Operator to Kubernetes.

Why build Operators with Ansible?

EXISTING SKILLS & ECOSYSTEM

Same tried & trusted Ansible tooling

Utilize existing skills

Supports cloud-native & traditional IT automation with one simple language

Leverages vibrant existing ecosystem

LOWER BARRIER OF ENTRY

No programming required

Faster iterations and easier maintenance

Declarative state definitions like K8s

Templating of resources

Abstraction layer & helpers that reduces necessary K8s API experience

Developing your first Operator with Ansible

- Initialize Your Operator With Ansible
 - `$ operator-sdk new foo-operator`
`--api-version=cache.example.com/v1alpha1 --kind=Foo --type=ansible`
- Automate With Ansible
 - Create new roles and playbooks or reuse an existing one
- Define a watches file
 - Map a Kubernetes object to your Ansible content
- Build Your Operator
 - `$ operator-sdk build foo-operator:v0.0.1`
- Deploy Your Operator to a Kubernetes Cluster
